

Reflection of Diet Digest

When working on this project, I encountered minimal problems. My partner and I were able to pull off this project. I would say that our main problem would have been KJ losing his flash drive towards the end of the project. To cope with this, we had to work on our project in pieced and then compile it instead of working straight into the InDesign document. We could only create new components until we found KJ's flash drive on presentation day, and at that time we finalized our product and was ready to present after 30 minutes of work time.

I feel that this piece is a really good project that is both eye appealing and informative. The writing is written with my word use so it represents my style of writing. The layout and design was engineered by KJ and shows his style of design. So in essence, our project is a great representation of both of our work. Our standards for this work was for it to be on time, meet all applicable requirements, and have a good overall look to the product. We met all of our requirements.

Last year in the Rube Goldberg project, the main thing was that I did all of the work myself as my group members did little work. It was tedious, but I finally got the project done and to my standards. In the Diet Digest, both KJ and I worked and collaborated to create a project that met/exceeded both of our standards.
